## 1 Cock-parse

### 1.1 cock-parse

**Module** cock-parse

**Description** The cock-parse module is responsible for the heavy lifting: creating docexprs (see below) from documented sources code; the drivers then write docexprs as e.g. LaTeX.

**Exports**

- parse-files
- tex-write-docexprs

### 1.2 current-docexpr

**Parameter** #f

**Description** Enables communication with the parsing @-reader

```
1 (define current-docexpr (make-parameter #f))
```

### 1.3 docexpr

**Record** docexpr

**Description** Composite documentation and adherent expression

**Fields** doc Documentation for the expression  
expr Expression surrounding the documentation

```
1 (define-record-and-printer docexpr doc expr)
```

### 1.4 parse-files

**Procedure** (parse-files . files) → Resultant docexprs

**Description** Parse files into docexprs.

**Parameters** files Cock-documented files to be parsed

```
1 (define (parse-files . files)
2   (parameterize
3     ((docexprs (make-stack)))
4     (for-each
5       (lambda (file)
6         (with-input-from-file
7           file
8           (lambda ()
9             (let read-next ((expression (read)))
10              (if (not (eof-object? expression))
11                  (begin
12                    (if (current-docexpr)
13                      (docexpr-expr-set! (stack-peek (docexprs)) expression))
14                    (current-docexpr #f)
15                    (read-next (read))))))))
16       files)
17   (docexprs))
```

### 1.5 tex-write-docexprs

**Procedure** (tex-write-docexprs docexprs) → unspecified

**Description** Write the source-derived docexprs as LaTeX.

**Parameters** docexprs The parsed docexprs

```

1 (define (tex-write-docexprs docexprs)
2   (let* ((document (make-document (make-hash-table) (make-stack)))
3         (parsed-docexprs (tex-parse-docexprs document docexprs)))
4     (let ((data (document-data document)))
5       (write-template
6         tex-preamble
7         `(author unquote (hash-table-ref/default data 'author "Anonymous"))
8         (email unquote
9           (hash-table-ref/default data 'email "anonymous@example.org"))
10        (title unquote (hash-table-ref/default data 'title "Documentation"))
11        (subtitle
12         unquote
13         (hash-table-ref/default data 'subtitle "Sub-documentation")))))
14   (stack-for-each parsed-docexprs (lambda (docexpr) (docexpr)))
15   (display tex-footer))

```
